

Actions Taken

The iMAP's IM support to RRM Frontline led to a diagnostic of the information system with a number of recommendations. These were prioritized and implemented in July 2021 with the review of data management processes, the drafting of standard operating procedures (SOPs) and the improvement of MSA products. The aim was to increase the reliability, strengthen the quality of the information collected, facilitate data analysis and information sharing.

Outcomes

iMAP supports the RRM Frontline in its change management initiatives regarding data management processes, the development of its information culture and the progressive implementation of good practices.

An information system was quickly set up, including roles, the platform as well as data collection tools. Despite these achievements, the data collection processes still need to be improved.

Aiming at improving and strengthening the quality of analysis and data management, the iMAP consultant designed new SOPs and tools after conducting an in-depth analysis of the RRM Frontline IM system.

Capacity Building

Capacity building is part of the iMAP support mandate to the RRM Frontline, the iMAP consultant has conducted training on computer graphics and infographics as well as data processing tools which will be subsequently followed by data visualization. A workshop was held to create a backlog and prioritize actions.
